

Puget Sound Periodontics and Implant Dentistry

Connective Tissue Grafts are completed in instances where gum recession has occurred and a long lasting result which includes coverage of the exposed root is desired. These tissue grafts utilize a patients own gum tissue (from the roof of the mouth) and are effecting in the treatment of one or more teeth. Sometimes these grafts are combined with biologic agents which may enhance the result and your doctor will review whether this would be of benefit for you or not.
